**BACKGROUND**

Clathrin-coated vesicles (CCVs) select cargo for endocytic entry into cells and generate carrier vesicles for transport between the endosomal system and trans-Golgi network (TGN). NECAP 1 and NECAP 2 are essential protein paralogues for clathrin-mediated membrane trafficking that are enriched in CCV coats. NECAP 1 (NECAP endocytosis associated 1), also known as adaptin ear-binding coat-associated protein 1, is a 275 amino acid cell membrane protein belonging to the NECAP family that localizes to the clathrin-coated vesicle membrane. NECAP 1 is encoded by a gene that maps to human chromosome 12p13.31 and contains two WXxF motifs which are used to mediate binding of accessory proteins to ear domains of various proteins such as AP-1, AP-2 and GGAs. Expressed primarily in brain and existing as two alternatively spliced isoforms, NECAP 1 colocalizes with AP-2 at the plasma membrane by binding AP-2s α-ear domain.
