BACKGROUND

Olfactory receptors are G protein-coupled receptors that localize to the cilia of olfactory sensory neurons where they display affinity for and bind to a variety of odor molecules. The genes encoding olfactory receptors comprise the largest family in the human genome. The binding of olfactory receptor proteins to odor molecules triggers a signal transduction that propagates nerve impulses throughout the body, ultimately leading to transmission of the signal to the brain and the subsequent perception of smell. OR1N1 (olfactory receptor 1N1), also known as olfactory receptor OR9-22, olfactory receptor 1-26 (OR1-26) or OR1N3, is a 311 amino acid amino acid multi-pass membrane protein that functions as an odorant receptor and belongs to the G-protein coupled receptor 1 family.
